## SECONDARY CLARIFIERS

# SECONDARY CLARIFIERS CONTENTS

1. Basic design parameters
2. Solids concentration profile
3. Sludge volume index
4. Underflow concentration and mass balance
5. Settling measurement
6. Solids flux analysis
7. State point analysis
8. RAS/WAS pumping
9. Scum removal
10. Design Examples

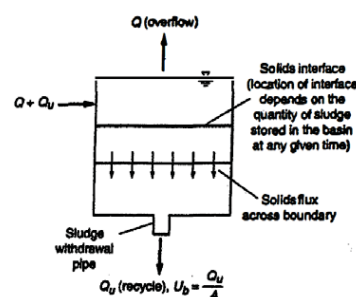

## SECONDARY CLARIFIER

# SECONDARY CLARIFIERS

- Functions
  - Clarification, separate solids from mixed liquor to produce a clarified effluent quality with low TSS.
  - Thickening, concentrate sludge to produce concentrated underflow(RAS) to maintain MLSS in aeration tank.
  - Conveyance, transferred sludge to aeration tanks or wasting.
  - Scum removal, remove scum/foam from the surface of the clarifier.
- Clarification Failure
  - Rise in effluent TSS, no sufficient time for solids settlement.
- Thickening Failure
  - Rise in sludge blanket depth, sludge removed slowly.
- Clarification & Thickening failure

## SURFACE OVERFLOW RATE(SOR)

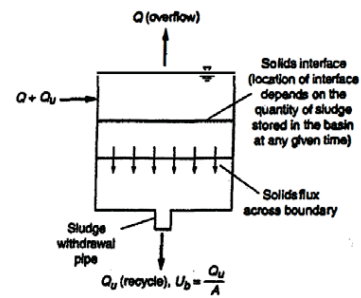

### • Surface Overflow Rate(SOR)

- The upward velocity of water.

$$SOR = \frac{Q}{A}$$

Q = Influent flowrate, m<sup>3</sup>/day  
 A = Clarifier Surface Area, m<sup>2</sup>  
 SOR = Surface Overflow rate, m<sup>3</sup>/m<sup>2</sup>.day

# SOLIDS LOADING RATE(SLR)

## • Solids Loading Rate(SLR)

– The mass of solids applied per unit area per time.

$$SLR = (Q + Q_R) \times \frac{X}{A}$$

|                |   |
|----------------|---|
| Q              | = Influent flowrate, m <sup>3</sup> /day                  |
| Q <sub>R</sub> | = Return activated sludge flowrate, m <sup>3</sup> /day   |
| A              | = Clarifier Surface Area, m <sup>2</sup>                  |
| X              | = MLSS entering the secondary clarifier, g/m <sup>3</sup> |
| SLR            | = Solids loading rate, kg TSS/m <sup>2</sup> .day         |

$$SOR = \frac{Q}{A}$$

7

Example for Clarifier Sizing

## SECONDARY CLARIFIERS SOLIDS CONCENTRATION PROFILE

When SLR exceeds the limiting flux, the sludge storage zone expands. Continuous expansion will result in the sludge interface reaching the effluent weir, causing loss of solids.

During normal operation, the storage zone expands and contracts in response to the diurnal fluctuation of solids loading; therefore sufficient clarifier depth should be provided to accommodate the routine expansion of the sludge blanket.

# Sludge Volume Index (SVI)

$$SVI = \frac{(\text{Settled volume of sludge, ml/l}) \times (1000 \text{ mg/g})}{(MLSS, \text{ mg/l})} = \frac{\text{ml}}{\text{g}}$$

$$SSVI = 4.1416 \times SVI^{0.621}$$

- The SVI is the volume of 1 g of sludge after 30 minutes of settling.
- SVI of 100 ml/g is considered good.
- SVI above 150 are typically associated with filamentous growth.
- Design for 125 mL/g
- Stirred SVI(SSVI)

## RETURN FLOW/RETURN SLUDGE CONCENTRATION AERATION TANK MASS-BALANCE

$$Q \times TSS + Q_{RAS} \times X_R = (Q + Q_{RAS}) \times X$$

Influent solids are negligible compared to MLSS

$$X_R = \frac{(Q + Q_{RAS}) \times X - Q \times TSS}{Q_{RAS}}$$

$$Q_R = \frac{XQ}{X_R - X}$$

$$TSS = 0$$

$$X_R = \frac{X \times (1 + R)}{R}$$

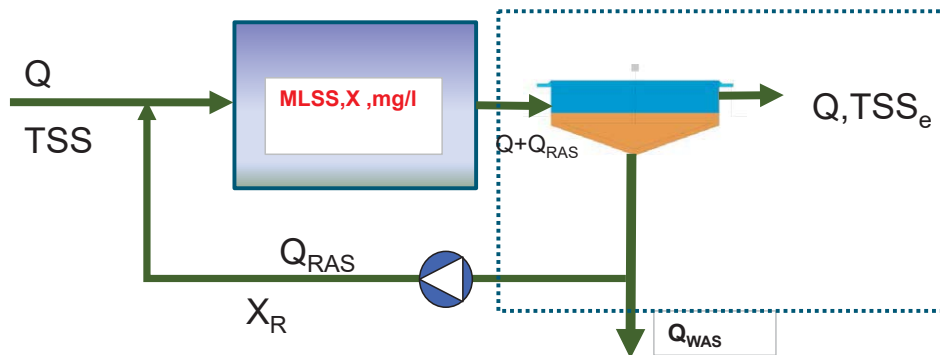

$$R = \frac{X}{X_R - X}$$

$$X = \frac{R \times X_R}{1 + R}$$

$$R = \frac{Q_{RAS}}{Q}$$

Aeration Tank  
Mass Balance

# RETURN FLOW/RETURN SLUDGE CONCENTRATION SECONDARY CLARIFIER MASS-BALANCE

$$(Q + Q_{RAS}) \times X = Q_{RAS} \times X_R + Q_{WAS} \times X_R + Q \times TSS_e$$

effluent solids are negligible

$$X_R = \frac{Q \times (1 + R) \times X}{Q \times R + Q_{WAS}} \quad R = \frac{Q_{RAS}}{Q} \quad TSS_e = 0$$

X=MLSS

$$Q_{RAS} = \frac{X \times Q - Q_{WAS} \times X_R}{X_R - X}$$

$$Q_{RAS} = \frac{X \times Q - \left[ \frac{XV}{SRT} \right]}{X_R - X}$$

$$R = \frac{1 - \left[ \frac{\tau}{SRT} \right]}{\left[ \frac{X_R}{X} \right] - 1}$$

Clarifier  
Mass Balance

## SETTLING MEASUREMENT

$$V_s = V_0 \times e^{-K \times MLSS}$$

Where:

$V_s$  = Settling velocity of the sludge at MLSS concentration

$V_0$  = Vesiland velocity constant, m/d

$K$  = hindered settling parameter constant, m<sup>3</sup>/kg

MLSS = mixed Liquor suspended solids, mg/l

- Settling column test is used to determine Vesiland constants. Proper settling column test data are not always available, therefore relationship between the constants and SVI have been developed as follows:
  - $V_0 = 170$  m/d.
  - $K = 0.1646 + 0.001586 \times SVI$   $K = 0.1646 + 0.001586 \times SVI$
- Should SVI data is not available it can be assumed as follows:
  - SVI=125 ml/g for designs with selectors
  - SVI=200 ml/g for aeration tanks without selectors.

# WHAT IS SOLIDS FLUX(G)

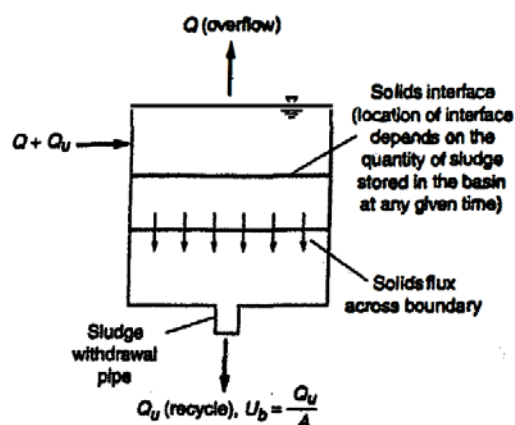

- Mass of solids passing to the clarifier in unit time per 1 m<sup>2</sup> of clarifier area.
- It is measured in kg/m<sup>2</sup>.hr or kg/m<sup>2</sup>.day

Solids flux is the movement of solids through clarifier

Solids Flux = mass **per** unit area **per** unit time

## SOLIDS FLUX ANALYSIS GRAVITY FLUX

- Solids are transported to the bottom of a secondary clarifier by two mechanisms:
  - Gravity flux, differential settling because of density differences between solids and water.
  - Bulk flux, bulk transport from sludge withdrawal.
- Gravity Flux ( $G_s$ )

$$G_s = MLSS \times V_s$$

$$V_s = V_0 \times e^{-K \times MLSS}$$

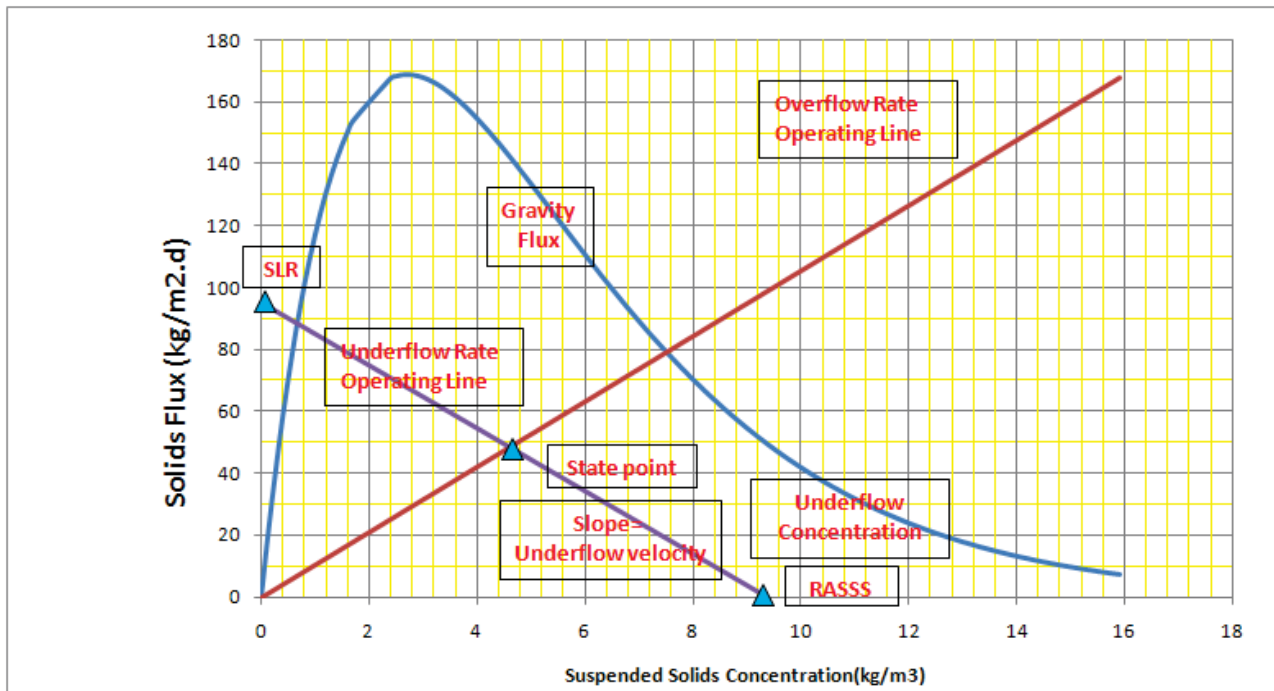

$$G_s = MLSS \times V_0 \times e^{-K \times MLSS}$$

Settling  
Curve

# STATE-POINT ANALYSIS

State Point Analysis

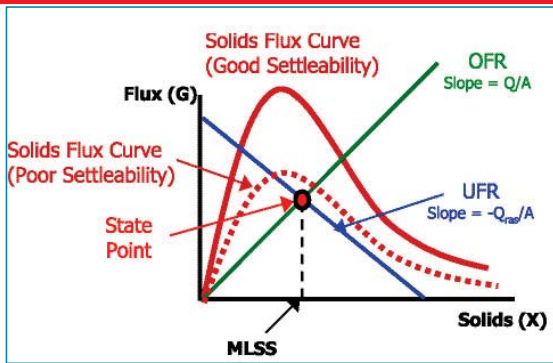

## INTERPRETATION OF THE STATE POINT ANALYSIS

| State Point            | Underflow Rate (UFR) Line                        | Clarification     | Thickening        | Corrective Action               |
|------------------------|--|-------------------|-------------------|---------------------------------|
| Within the flux Curve  | Below the descending limb of the flux curve      | Underloaded       | Underloaded       | None                            |
| Within the flux curve  | tangent to the descending limb of the flux curve | Underloaded       | Critically loaded | Increase RAS Rate<br>Lower MLSS |
| Within the flux curve  | Intersects the descending limb of the flux curve | Underloaded       | Overloaded        | Improve SVI<br>Lower MLSS       |
| On the flux curve      | Below the descending limb of the flux curve      | Critically loaded | Underloaded       | Increase clarifiers area        |

## EXAMPLE-1 ON STATE POINT ANALYSIS

- Determine the minimum clarifier area required to accommodate the maximum day flow for treatment plant with the following design parameters:

|                    |        |                      |
|--------------------|--------|----------------------|
| $V_0$              | 156    | m/d                  |
| SVI                | 200    | ml/g                 |
| K                  | 0.4818 | m <sup>3</sup> /Kg   |
| Q                  | 13100  | m <sup>3</sup> /day  |
| $Q_R$              | 9500   | m <sup>3</sup> /day  |
| R                  | 0.73   |                      |
| Clarifier Area (A) | 770    | m <sup>2</sup>       |
| $V_u$              | 12.34  | m/d                  |
| $V_o$              | 17.01  | m/d                  |
| X                  | 4,200  | mg/l                 |
| $X_R$              | 9,992  | mg/l                 |
| SLR                | 123    | kg/m <sup>2</sup> .d |

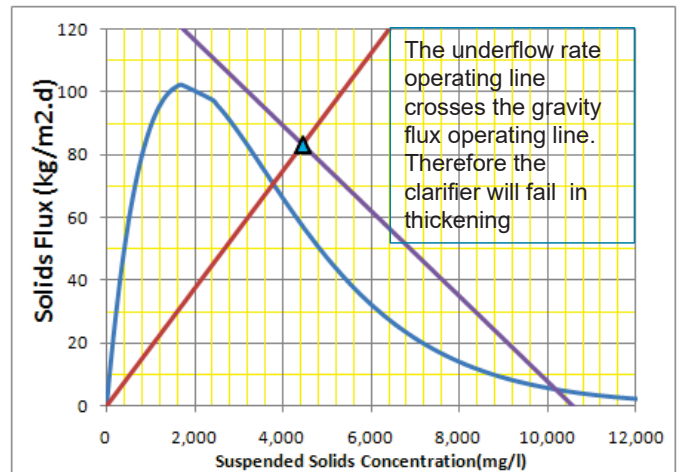

Example-1

# EXAMPLE-2 ON STATE POINT ANALYSIS

- WWTP has a secondary clarifiers surface area of 700 m<sup>2</sup> operating under max day flow of 13100 m<sup>3</sup>/day, return sludge = 9500 m<sup>3</sup>/day and MLSS=4450mg/l. IF the SVI is 250 mg/l will the clarifiers operate properly.

|                    |        |                      |
|--------------------|--------|----------------------|
| V <sub>0</sub>     | 156    | m/d                  |
| SVI                | 250    | ml/g                 |
| K                  | 0.5611 | m <sup>3</sup> /Kg   |
| Q                  | 13100  | m <sup>3</sup> /day  |
| Q <sub>R</sub>     | 9500   | m <sup>3</sup> /day  |
| R                  | 0.73   |                      |
| Clarifier Area (A) | 700    | m <sup>2</sup>       |
| V <sub>u</sub>     | 13.57  | m/d                  |
| V <sub>o</sub>     | 18.71  | m/d                  |
| X                  | 4,450  | mg/l                 |
| X <sub>R</sub>     | 10,586 | mg/l                 |
| SLR                | 144    | kg/m <sup>2</sup> .d |

Example 2  
High SVI

# EXAMPLE-3 ON STATE POINT ANALYSIS

- Would the clarifier area given in Example 1 function properly at PHF of 38,000 m<sup>3</sup>/day.

|                    |        |                      |
|--------------------|--------|----------------------|
| V <sub>0</sub>     | 156    | m/d                  |
| SVI                | 200    | ml/g                 |
| K                  | 0.4818 | m <sup>3</sup> /Kg   |
| Q                  | 38000  | m <sup>3</sup> /day  |
| Q <sub>R</sub>     | 9500   | m <sup>3</sup> /day  |
| R                  | 0.25   |                      |
| Clarifier Area (A) | 700    | m <sup>2</sup>       |
| V <sub>u</sub>     | 13.57  | m/d                  |
| V <sub>o</sub>     | 54.29  | m/d                  |
| X                  | 2,000  | mg/l                 |
| X <sub>R</sub>     | 10,000 | mg/l                 |
| SLR                | 136    | kg/m <sup>2</sup> .d |

Example-3

# MINIMUM REQUIRED AREA FOR THICKENING

- Solids load/Applied flux to clarifier

$$SLR = (Q + Q_{RAS}) \times \frac{MLSS}{\text{Clarifier\_Area}}$$

$$R = \frac{Q_{RAS}}{Q}$$

$$X_R = \frac{MLSS \times (1 + R)}{R}$$

$$SLR(Ga) = \frac{Q \times MLSS * (R + 1)}{A}$$

By setting SLR equal to the limiting flux, the minimum clarifier area required for thickening can be solved

UNDER FLOW RATE FLUX

$$UFR(U_F) = \frac{-Q \times R \times (X - X_R)}{A}$$

# SECONDARY CLARIFIERS DETAILS

- Diameters
  - 9 to 42 m.
- Side water depth
  - 4.25 m for diameters less than 20 m.
  - 5 m for diameters between 20 and 38 m.
  - 5.5 m for diameters greater than 38 m.
- Bottom Slopes
  - Clarifiers with hydraulic suction type mechanism , max 1 in 12 bottom slope.
  - Clarifiers with scraper type mechanisms, preferable 1 in 10 bottom slope.

# RETURN ACTIVATED SLUDGE

- RAS = Return Activated Sludge.
- Purpose of RAS line is to keep MLSS in the aeration tank
- RAS rate must be sufficient to prevent accumulation of MLSS in the Secondary Clarifier
- RAS rate must be less than critical underflow rate, otherwise there is a risk of solids overload.

# SURPLUS ACTIVATED SLUDGE (WAS,SAS)

- **Purpose**
  - Control a desired MLSS level
  - Control a desired sludge age.
- **Quantity**
  - $BOD \times Y_{obs}$  (kg/d)
  - Typical concentration 5000 – 8000 mg/L
- **Control**
  - SAS flow meter, volume control
  - Adjust volume to maintain the target MLSS level

# RAS/WAS PUMPING

- Continuous sludge withdrawal should be provided.
- It is preferable to have a dedicated pump per clarifier with flow measurement and control.
- Three pumps(2 duty,1 standby) should be provided for every two clarifiers. The pumps can be connected by a common header, but valves should be arranged so that one clarifier can be isolated.
- Variable speed pumps should be provided to discharge variable quantities of sludge depending on process requirements.
- The rate of RAS pumping is a function of the recycle ratios required to maintain the design MLSS. It ranges between 20% to 100% for conventional activated plants and 30% to 150% for extended aeration.
- Sludge piping should be at least 100 mm dia with a minimum velocity of 0.6 m/s.
- Means for measurement of flow, taking samples, draining and flushing lines should be considered in the design.
